Appendix: Microbiology Data Form Instructions

1. Introduction

Monitoring the kind and numbers of microorganisms present at certain sites on spacecraft crewmembers and their quarters provides information about two important aspects of the crew's health status. First, observations taken prior to flight could reveal the presence of pathogens which could cause illness during flight and second, changes in microflora due to special conditions imposed by spaceflight such as isolation, diet and weightlessness, could be indicated by comparison of pre- and postflight data. Such data were collected during the Apollo flights and that practice, with some refinement, was continued for SMEAT and Skylab.

This project was concerned with the management and analysis of crew and environmental microbiological data from SMEAT and Skylab. Samples were collected from ten different body sites on each SMEAT and Skylab crewmember on approximately 50 occasions and since several different organisms could be isolated from each sample, several thousand lab reports were generated. These lab reports were coded and entered in a computer file and from the file various tabular summaries were constructed. Data presented in this form could be more easily interpreted and statistical analyses more readily performed.

The data management system was begun in May of 1972 with the initial decisions about the content and format of the Microbiology Data Forms to be used to transfer information from the microbiology labs to keypunch and thence to the computer files. As the files grew with the accumulation of SMEAT reports, data grooming techniques were developed and the first draft summary tables were constructed after consultation with Dr. J. L. McQueen, Task Monitor, and other JSC personnel. After a few month's experience a

suitable data handling system and report format evolved and from that point on, the major effort was in keeping up with the volume of reports and maintaining the accuracy of the entries.

As the summary tables were produced, they were given to JSC microbiologists. Statistical consultation was provided upon request and the results of these investigations published in various reports.

This final report contains a detailed description of this system and its operation along with the resulting summaries and analyses of the microbiology data. Computer tapes containing the various data bases and the programs developed during the course of this contract have already been furnished to JSC.

2. Data Management System

a. Organization

Associated with each sample processed by the microbiology lab is information concerning the sample date, type, source and area as well as the identity and quantity of organisms detected. Unique numerical codes were assigned to each of these items, including the names of several hundred microorganisms. These codes, as well as prose descriptions were entered by the lab personnel on MSC Form 1238, illustrated in Figure 1.

| MICROBIOLOGY DATA | | | | | | | | | | WORK NO. <u>00034</u> | |

MSC FORM 1238 (JUN 72)
U.S. GOVERNMENT PRINTING OFFICE: 1972-779-479/15

COMPLETE/CONTRACTOR COPY

Figure 1 - MSC Form 1238

Instructions for completion of this form and the disposition of the various copies were given to the lab personnel and all others involved in the use of the system. These instructions appear in the Appendix to this report, Microbiology Data Form Instructions.

Once the forms were completed, one copy (COMPLETE/MSD) was sent to be keypunched and verified and then returned to a file maintained at JSC. The forms were filed by ID number (columns 1-7) within SMEAT and each Skylab flight. This file will be returned to JSC at the end of the contract.

The cards keypunched from the Microbiology Data forms were read into computer files at University of Texas at Houston Education and Research Computer Center (UTHERRC). Editing of these files was then accomplished from a terminal located at JSC.

Summary tables generated from these files were printed at M. D. Anderson Hospital (the line printer there was best suited to our purposes) and delivered to JSC.

The essential steps in the data handling procedures are illustrated in Figure 2.

Figure 2 - Data Management System

b. SMEAT and Skylab Data Bases

Separate computer files were established for SMEAT, SMEAT food, and each of the three Skylab flights. After the data were entered in the system, preliminary data editing procedures were used to detect the presence of incomplete or duplicate reports.

To insure the completeness of the computer files, each of the crew microbiology records was matched with the corresponding Microbiology Data Form and all inconsistencies were resolved. The accuracy of the coded information was checked by randomly selecting 237 cards and comparing each of the 48 columns used on each card with the corresponding entry in the computer record. Of the approximately 11,376 entries thus checked, only four were found to be in error.

As the files were readied, tape copies were made and delivered to JSC for use on computers located there. Table 1 lists the various data bases, their source and the number of records (Microbiology Data reports) in each.

| <u>Data Base</u> | <u>Source</u> | <u>Records</u> |
|------------------|---------------|----------------|
| SMEAT1 | SMEAT | 4221 |
| SMFOOD | SMEAT Food | 289 |
| SL2DB | SL 2 | 2035 |
| SL3DB | SL 3 | 1546 |
| SL4DB | SL 4 | <u>1432</u> |
| TOTAL | | 9523 |

Table 1 - Microbiology Data Bases

c. Summary Tables

As experience with the system was gained, it appeared that two basic types of summary tables, the Incidence and Quantitation Tables, would be most helpful in analysing the data.

The Incidence Table, illustrated in Figure 3, reports the presence (by a 1) of given organisms by date, astronaut and sample site. These tables were also used to detect duplicate entries since only Staph.aureus (differentiated by phage type) can be reported more than once at a given location and time.

| Flight, Astronaut, Sample Site | | | | | |
|--------------------------------|---|---|---|---|-------|
| Sample Date | 1 | 2 | 3 | 4 | Total |
| Organism 1 | 0 | 1 | 1 | 0 | 2 |
| Organism 2 | 1 | 0 | 1 | 0 | 2 |
| Organism 3 | 0 | 0 | 0 | 1 | 1 |
| Genus Total | 1 | 1 | 2 | 1 | |

Figure 3 - Incidence Table Format

The names (genus, species, variety) of the organisms present are listed in alphabetical order within each of the four groups (aerobic bacteria, anaerobic bacteria, filamentous fungi, yeast) as indicated in Appendix A of the Microbiology Data Form Instructions. Within each group, the organisms are divided by genus and column totals for both genera and groups are printed. Row totals for each organism are also printed.

Quantitation Tables are organized in the same way with the report of incidence (0 or 1) being replaced by the count (quantitation) of the organism. In a few instances, the presence of an organism was noted, but because of some special circumstance in the lab, the quantitation was not obtained. In these few cases, these organisms appear in the Incidence Table but not in the corresponding Quantitation Table. Figure 4 illustrates the organization of the Quantitation Tables.

| Flight, Astronaut, Sample Site | | | | |
|--------------------------------|-----------|-----------|-----------|----------|
| Sample Date | 1 | 2 | 3 | Total |
| Organism 1 | .3000E+03 | .5100E+02 | 0. | .351E+03 |
| Organism 2 | 0. | 0. | .1000E+02 | .100E+02 |
| Organism 3 | .7700E+04 | .9000E+02 | .1000E+03 | .789E+04 |
| Genus Total | .800E+04 | .141E+03 | .110E+03 | |

Figure 4 - Quantitation Table Format

For each flight, astronaut and sample site, both Incidence and Quantitation Tables were constructed. In addition, composite tables for the seven skin sites were made for each astronaut and a composite table for each sample site over the three astronauts was made for each flight.

The crew microbiology tables show both incidence and quantitation of organisms for the sample sites indicated in Table 2.

| | |
|--------------|----------------------------|
| 7 Skin Sites | (composite of those below) |
| Skin Site 1 | (Neck) |
| Skin Site 3 | (Ear) |
| Skin Site 4 | (Axilla) |
| Skin Site 5 | (Hands) |
| Skin Site 6 | (Umbillicus) |
| Skin Site 7 | (Groin) |
| Skin Site 8 | (Toe Web) |
| Gargle | |
| Nasal | |
| Feces | |

Table 2 - Crew Microbiology Sample Sites

Tables showing incidence of microorganisms in SMEAT food were also generated.

Due to space limitations on the computer paper (particularly for the Quantitation Tables) it was necessary to break these individual tables into as many as five different segments. These segments are bound together and accompanied by an index indicating the arrangement in each instance. This collection of tables will be presented to the JSC task monitor at the end of the contract period.

To simplify coding and calculations, Julian dates were used throughout the data management system. Table 3 shows the number of sample dates for each flight and Tables 4, 5, 6, and 7 show the actual dates of each sample.

| | Preflight | Intraflight | Postflight |
|----------|-----------|-------------|------------|
| SMEAT | 12 | 8 | 8 |
| Skylab 2 | 5 | 0 | 3 |
| Skylab 3 | 4 | 0 | 3 |
| Skylab 4 | 5 | 0 | 3 |

d. Computer Programs

The main purpose of the computer programs generated in the course of this contract was to tabulate and print information selected from the rather large data files. These programs were copied on tape and delivered to the JSC task monitor. The UT programmer provided consultation to JSC programmers to enable them to run the programs on the JSC computer system. Sample data bases were also provided to check the programs. These programs are now operational on the JSC system.

3. Personnel

The time of the principal investigator, Dr. Thomas D. Downs, was furnished without cost to the project. Nine other individuals were involved as indicated in Table 8.

| <u>Employee</u> | <u>Job</u> | <u>Employed</u> | <u>Terminated</u> |

| 1. Introduction | 1 |
| 2. Microbiology Data Card Format | 5 |

Appendix A - Organism Codes

Appendix B - Gram Codes

Appendix C - Medically Important Organisms

Appendix D - Technician Codes

1. INTRODUCTION

The purpose of the Microbiology Data form is to allow information from the various microbiology labs to be reported in such a way that it may be readily key punched and then entered in a computer storage system. This requires that the information be coded as explained in the Microbiology Data Card Format and the various copies handled as described in this instruction sheet.

1. Disposition of Copies

The Microbiology Data Form consists of six copies which are identical except for color and a notation in the lower right corner indicating the intended use. Beginning with the original (copy 1) the designations are:

| | |
|-----------------------------------|--------------|
| Copy 1 - Complete/Contractor copy | (white) |
| Copy 2 - Complete/JSC file | (blue) |
| Copy 3 - Bacteriology copy | (green) |
| Copy 4 - First partial | (yellow) |
| Copy 5 - Second partial | (pink) |
| Copy 6 - Initiator copy | (golden rod) |

Since evaluation of a given sample may involve more than one lab, provision has been made to allow partial reports. Any unneeded copies may be discarded.

2. Open Lists

The codes listed for each of the items on the Microbiology Data Card Format sheet are intended to uniquely designate each possible response for that item. If additional responses are needed, these can be coded and added to the list by data collection personnel.

3. Abbreviations

Some items (e.g., Sample Type, Col. 19) require a written as well as a coded response. This provides a means for checking the consistency of the response (i.e., the code should match the word). Acceptable abbreviations are indicated by underlining on the Data Card Format sheet.

4. Missing Data

If the appropriate response for a given item is not available because of accident or error, that item should be given the code for "datum missing" which in most cases is all zeros, and in every case is clearly indicated. Note that this is different than "not applicable".

Blank columns are permissible on partial reports, but not on the final report (copies 1 and 2). Any item still missing when the final report is submitted should be shown as "datum missing".

5. Explanation of Coded Items

It is important to use code exactly as described in the Microbiology Data Card Format and to make entries in all appropriate columns, even if the response might be "not applicable". This allows those handling the reports to distinguish among incomplete reports, non-applicable items, and missing data. Do not omit leading zeros; they are a part of the code also.

Columns 1-2: Identifies the lab area from which the information comes, this becomes a part of the ID number of this report. This number is to be assigned by the initiating lab, even though the report might be updated in other labs.

- Columns 3-7: Preprinted ID number which is used to link the lab worksheets, the report forms, the IBM cards punched from these forms, and ultimately the card image on magnetic tape. This number must be transferred to the lab worksheet.
- Columns 8-9: Identifies the technician making the initial report.
- Column 10: This space may be ignored; except in the case of the SMEAT food study as explained below.
- Column 12: Identifies the test (e.g., SMEAT, SL-2, SL-3, SL-4) in which the data originated.
- Columns 13-17: The Julian date of the sample collection, e.g. June 21, 1972, is 173-72.
- Columns 24-25: Codes 00, 01, 02, 05, 06, 08, 09 constitute full reporting of quantitation; if these are used, draw a line thru columns 27-31.
- Columns 27-31: If 4, 7, or 10 appears in columns 24-25, enter the appropriate quantitation in scientific notation. If the colonies are TNTC, enter the value of the last dilution in columns 27-31. Use zeros to avoid leaving any blank columns.
- Column 48: If a 0, 1, 2, or 3 are coded in column 48, a line should be drawn through "boxes" 49 thru 72.
- Column 49-71: Enter the phage type in the usual notation. Use a zero in unneeded columns to right justify within each triplet boxes; e.g.: 32A/052/053/60B. Draw a line through any unused boxes.

6. Update ID - Delete ID

If it is found for any reason (such as summing of counts to get correct quantitation or correcting mistakes) that previously reported data must be changed, proceed as follows: Make out a new data form with the correct data and at the bottom under the Delete ID section, indicate the complete number of all previously submitted data forms which must be deleted from the data system. The Update ID column at the bottom of the form is not to be used at this time.

2. MICROBIOLOGY DATA CARD FORMAT

| Columns | Contents | Code | Description |
|---------|-----------------------|--|-------------|
| 1-2 | Lab area | 01 - Crew aerobic bacteriology 02 - Crew anaerobic bacteriology 03 - Crew mycology 04 - Environmental bacteriology 05 - Environmental mycology 06 - Crew mycoplasma 07 - Crew virology 08 - Serology 09 - Crew parasitology 10 - IMSS - Bacteriology 11 - IMSS - Mycology 12 - SMEAT food 13 - Skylab food | |
| 3-7 | Identification Number | (pre-numbered) | |
| 8-9 | Technician | See appendix D | |
| 10 | Report status | IGNORE, except for Skylab food study, use these codes only: 1 - Frozen 0 hours 2 - Frozen 4 hours 3 - Frozen 8 hours 4 - Frozen 24 hours 5 - Control 6 - A Can 7 - B Can | |
| 12 | Test number | 1 - SMEAT 2 - Skylab 2 3 - Skylab 3 4 - Skylab 4 | |
| 13-15 | Sample Date | Day of year | |
| 16-17 | Sample Date | Year | |
| 19 | Sample Type | 0 - Datum missing 1 - Regular (crew) 2 - Illness contingency 3 - Hardware contingency 4 - OWS preflight 5 - CM preflight 6 - CM postflight 7 - IMSS preflight | |

GRAM CODES

APPENDIX B

Codes for Gram columns 46-47

- 00 - Datum missing
- 01 - Not applicable
- 02 - Gram positive rod
- 03 - Gram negative rod
- 04 - Gram positive cocci in pairs or chains
- 05 - Gram negative cocci in pairs or clusters
- 06 - Gram positive cocci in clusters
- 07 - Gram negative cocco-bacilli
- 08 - Gram positive sporulating rod
- 09 - Gram negative sporulating rod
- 10 - Gram positive rod, bifidated end
- 11 - Gram negative rod, rounded ends
- 12 - Gram negative rod, tapered ends
- 13 - Gram positive branching rods

APPENDIX C

MEDICALLY IMPORTANT ORGANISMS

APPENDIX C

Organisms to be Coded as MEDICALLY IMPORTANT*

GENERAL

1. ALL ORGANISMS isolated from CONTINGENCY SPECIMENS

SKIN

1. Staph. aureus
2. Strep. spp. (B-hemolytic, group A)
3. Strep. spp. (B-hemolytic, not group A if predominant organism)
4. Proteus spp.
5. Pseudomonas spp.
6. Clostridium spp.
7. Shigella spp.
8. Salmonella spp.
9. Moraxella spp.
10. Herellea spp.
11. Candida albicans
12. Aspergillus spp.

THROAT

1. Strep. spp. (B-hemolytic, group A)
2. Strep. spp. (B-hemolytic, not group A but predominant organism)
3. Strep. spp. (A or G hemolytic if predominating organism)
4. Staph. aureus
5. Diplococcus pneu.
6. Proteus spp.
7. Pseudomonas spp.
8. Klebsiella spp.
9. Other coliforms
10. Haemophilus spp.
11. Neisseria mening.
12. Cory. diph.
13. Candida albicans

URINE

1. ANY ORGANISM $\geq 10^5$ per ml
2. ANY GRAM NEG. $\geq 10^3$ per ml
3. Salmonella spp. (regardless of count)
4. Shigella spp. (regardless of count)

5. *Candida albicans* (regardless of count)
6. *Proteus* spp. (regardless of count)
7. *Pseudomonas* spp. (regardless of count)
8. *Herella* spp. (regardless of count)
9. *Gonococcus* (regardless of count)
10. *Mima polymor.* (regardless of count)
11. *Strep.* spp. (B-hemolytic, A or not A)

* All organisms associated with a specific disease or syndrome (e.g. *Myco. tuberculosis* or *Gonococcus*) should be reported as medically significant regardless of the specimen or quantitation.
